What Does Photoshop Do? Photoshop is an image editing software designed to mimic the look of traditional photographic film. It's used for image retouching, photo manipulation, and for general purposes, including creating graphics. The program's interface is user-friendly and has many features that are useful to designers, photographers, artists, graphic designers, and others. Typical Photoshop editing functions, such as cropping, resizing, texturing, and

adding backgrounds, are common features that are provided by any image editor software. Other editing tasks, however, are unique to Photoshop. Photoshop's comprehensive toolsets include:

Raster Image Manipulation (RIM) Tools Raster editing tools, also known as raster image processing tools, let you manipulate and edit digital images. They are especially helpful for the tasks that Photoshop is most used for — image retouching and photo manipulation. (Also see: Adobe Photoshop: The Basics.)

Layers

Layers let you organize groups of pixels — essentially sets of individual pixels — into different parts of a single digital image. Layer settings, such as transparency, opacity, and blending settings, can be set for each layer. Layers give you the ability to continue editing an image without destroying what you've already done.

Folders Folders, also known as layer folders, let you organize layers into folders. Folders also help keep files clean and clutter-free. Folders are the easiest way to organize and manipulate layers.

Clips Clips, also

known as layer masks, give you the ability to hide or show selected layers within a layer group. Adjustment Layers Adjustment layers can be used to manipulate the appearance of individual pixels of an image, such as correcting color and brightness.

Adjustment layers and layer masks are commonly used for black and white conversion. Plug-ins Plug-ins are programs that often automate Photoshop tasks. For example, ColorPix is an excellent plug-in that's good for correcting color in a digital image. Color Management Color

management lets you import and export image files with an international look. It's important in today's global economy, where your image's appearance is often critical to the success of your business. Digital image file formats commonly used today (such as Photoshop PSD, JPEG, TIFF, and GIF) contain no color information. Thus, these file formats cannot be formatted using a

In this Photoshop section, we will

look at all the tools and features of Photoshop. We'll look at the main tools and features and some of the ways that they help you to edit and create images. How do I import a Photoshop file into Photoshop Elements? If you're an artist, graphic designer, photographer or web designer, you'll probably use Photoshop to edit images, create new high-quality images, or both. Photoshop is the de facto standard software that people use to create high-quality images. It's what most graphic designers and photographers use. One

of the things that makes Photoshop so popular is that people don't need to buy a copy of Photoshop. Photoshop Elements is a free, popular alternative to Photoshop that doesn't require a Photoshop disc. In Photoshop Elements, there are some of the tools that you use in Photoshop and some of the features you use in Photoshop. So, you can use Photoshop Elements to create images with the tools that you know and love, but with fewer features and a simplified user interface. How do I create a document in Photoshop Elements? In Photoshop

Elements, creating a new document is much the same as in Photoshop and is easy. If you use a Mac or a PC, there are also other ways to create a new document in Photoshop Elements. You can create a document from the program's Window menu. You can also use the File menu or the drop-down menus that appear when you click on the new document icon in the workspace. Where can I find the Photoshop Elements main tools and features? The tools and features of Photoshop are still there in Elements. Let's take a closer look at some of the

main tools and features: The best way to learn to use Photoshop elements is to start practicing with the new Learn to Use tool. By clicking on the Tools icon at the top of your workspace, you'll see the toolbar you'll use throughout Elements. The Workspace icons at the bottom of the workspace let you change the background and workspace colors. Toolbox is a button at the top of the workspace that gives you access to all the tools. Finder is a button at the top of the workspace. This lets you find photos and give them a color, crop, adjust brightness,

Q: C# Redirect output of thread to another thread I have a console application that starts another console application (in a separate thread). I would like to redirect the output of this thread so I don't see any output from the starting console application. How can I do this? For example:

```
ThreadStart threadStart = new  
ThreadStart(() => { //start my new  
console application }); Thread thread  
= new Thread(threadStart);  
thread.Start();
```

Console.WriteLine("Stuff here");
thread.Join(); Is there any way to get
rid of that console.WriteLine("Stuff
here"); line? A: There are a lot of
ways to do this (including using
Named Pipe). But a simple way is to
use the StreamWriter constructor that
takes an object that inherits from
Stream. The StreamWriter object
reads a Stream and then writes it to
another Stream. In your case, this
means that you will write the output to
a Console.In class. This should help
you get started: using System; using
System.IO; using System.Threading;

```
using System.Threading.Tasks;
namespace ConsoleApplication1 {
public class Program { private static
void Main(string[] args) { Task
myTask = CreateTask();
Console.WriteLine("Press any key to
start the task..."); Console.ReadKey();
Console.WriteLine(" Now type "exit"
to end the task...");
Console.ReadKey(); myTask.Wait();
} private static Task CreateTask() {
ThreadStart threadStart = new
ThreadStart(() => {
```

Q: casperjs casper.page.left and casper.page.top on Mac OSX I am experiencing issues with my script on Mac OSX. I am trying to set the left and top location of casper.page using casper.page.left = 0 casper.page.top = 0 But nothing changes (even after adding in the dimensions I need). This is my code: var casper = require('casper').create(); casper.start(URL, function(){ casper.page.left = 0; casper.page.top = 0; casper.addPage(0, 0, "some title"); //var pageHeight =

```
casper.getPageHeight();
//casper.page.height = pageHeight +
10; //var pageWidth =
casper.getPageWidth();
//casper.page.width = pageWidth; });
casper.run();
```

I've tried commenting out all the getter and setter values and those as well didn't work. A: I had to set `require('casper').page.viewportSize.height = casper.getViewportSize().height;` `require('casper').page.viewportSize.width = casper.getViewportSize().width;` and it worked. Once again...the wind from the east... 10/29/2013 Once

again, it's the windy West Coast that wins. I knew there were going to be high pressure cells in the area over the next few days, but I didn't anticipate the system that generated the storm front to be so strong. The chart above, which was taken at 1:30 AM ET on Monday, October 28, shows the upper-level pattern that created this high pressure system. To the east, there was a large area of low pressure. To the west, there was also a very large area of very cold air. These two large areas of cold air were split by a zone of high pressure, causing the wind to

come out of the west. The winds moved into the Pacific Northwest and started pushing towards Vancouver, British Columbia in about one hour. The winds were quite strong
